1.0 Preface

Advocacy, Awareness, Capacity Building (AACB) and Public Participatory Platforms are two of the subsectors of the Water Sector Transformation 2040 (WST2040) spearheaded by the Academy of Sciences Malaysia (ASM) in collaboration with the Economic Planning Unit (EPU), Prime Minister's Department of Malaysia. Universiti Kebangsaan Malaysia (UKM) has been entrusted to develop the Integrated Water Resource Management (IWRM) modules to achieve the ambitious mission of transforming the water sector by accelerating the implementation of IWRM, enhancing the usage of innovative water technology, achieving economy of scales and making Malaysia the Regional Water Hub over four Malaysia Plans from the 12th MP (2021-2025) through the 15th MPs (2036 - 2040.

The AACB sub-sector focuses on five priority areas: the People as the main driver, and Governance, Information, Finance and Infrastructure as the enablers. The objectives are to ensure water security and sustainability and promote water as an economic opportunity. The AACB sub-sector has developed four modules for different groups of stakeholders, namely: 1) Business & Industry, 2) Government, 3) Community and 4) Academia.

Businesses and industries are the key drivers for the country's economy — playing an essential role in driving the water resources conservation and management of the country. The Business & Industry module aims to 1) provide guidance to businesses and industries; 2) benchmark their current water management practices towards sustainability; and 3) promote responsible practices in managing their water resources throughout the value chain. The targeted audiences of this module are Public-listed Companies in Bursa Malaysia, Halal Parks/Industrial Parks/Estate Parks as well as Small Medium Enterprises whereby this module will adopt the IWRM approach in guiding businesses and industries in sustainable water management practices.

We acknowledge the inputs from various stakeholders who have been instrumental in developing this AACB IWRM (Business & Industry) Training Module. We, hereby, would like to express our gratitude to the Economic Planning Unit (EPU) and the Academy of Sciences Malaysia (ASM) for the commitment to make businesses and industries be more sustainable.

Thank you.

2.0 Introduction

Water Sector Transformation (WST2040) has been launched by the Economic Planning Unit (EPU) to accelerate the implementation of Integrated Water Resource Management (IWRM) and provide a foundation for water sector transformation. The WST2040 agenda will take place over a 20-year time frame, spanning through four Malaysia Plans (i.e., 12th to 15th MP) until 2040. The EPU has appointed eight taskforces to work on various sub-sectors in achieving water security and sustainability as well as water as an economic opportunity whereby the eight taskforces are:

Advocacy, Awareness and Capacity Building (AACB) taskforce aims to advocate, raise awareness and build capacity among stakeholders through training and capacity building programmes to improve current water resources management systems and practices in Malaysia. In the AACB taskforce, four clusters have been identified based on the quadruple helix model, namely Government, Business & Industry, Community and Academic clusters. For each of the clusters, a training module that is a part of the AACB programme have been developed to deliver the capacity building materials for the aforementioned clusters. Each of these training modules are divided into three levels:

- (i) The elementary level provides an overview of the landscape of business and industry sectors in Malaysia. Water consumption and wastewater generation in business and industry sectors, water-related policies, legal implications and economic incentives to accelerate IWRM implementation in Malaysia will be illustrated. The elementary level is designed to create AWARENESS about sustainable water management among support staff in companies.
- (ii) The intermediate level provides the concepts that need to be adopted by the participants to shift the paradigm in water management where the participants are hoped to advocate for transformation in their management practices. The intermediate level is designed to promote ADVOCACY for IWRM among executive staff in companies.
- (iii) The advanced level provides the six-step principles as the action framework and benchmark to be adopted and emulated by participants when they return to their organisations. The advanced level is designed to equip EHS and sustainability-related professionals as well as top management with the CAPACITY BUILDING capabilities to

accelerate the implementation of IWRM in their respective organisations and river basins.

Figure 2.1 shows the Water Sector Transformation (WST2040) framework to guide the rollout of the initiatives and programmes whereby strategies and roadmap are recommended and organised according to the objectives of the driver (i.e., People) and respective enablers (i.e., Governance, Information & RDCI, Finance and Infrastructure & Technology). Table 2.1 shows the strategies and roadmap for the Business & Industry cluster.

Figure 2.1 Water Sector Transformation (WST2040) framework

(i) **PEOPLE**

People have been identified as the driver for WST2040 that aims to empower people to drive water sector transformation. In the context of the Business & Industry cluster, human capital has been seen as the prime mover in driving AACB. To date, there are 952 companies listed under Bursa Malaysia (denoted as Cluster A), 247 industrial parks, halal parks and estate parks (denoted as Cluster B) and 5,652,560 small and micro-business and industry establishments in various sectors (denoted as Cluster C) all of which account for millions of workforces in the business and industry sectors of Malaysia. AACB for Business & Industry cluster covers the understanding of policy on IWRM, stakeholders involved, water cycle as well as the importance of IWRM to the people and the country.

Under the pillar of People, it is recommended for the Ministry of Environment and Water (KASA) to provide a holistic 'Training of Trainers' capacity building programme for the stakeholders of the Business & Industry cluster in which the capacity building module will include awareness-raising on demand management and how business and industry could play a role in addressing risks and environmental consequences of their operations and improving water efficiency and sustainability. It is targeted that in the 12th MP for the Business & Industry cluster, the first batch of 900 personnel from Clusters A, B and C will be trained as resource persons. The number of resource persons will propagate stepwise in which the training will be conducted quarterly by KASA to ensure 100% of business and industry entities in Clusters A and B will have attended the AACB 'Training of Trainers' programme by the 15th MP. Considering the big pool of business and industry establishments in Cluster C, the aim is to prioritise the critical sectors of Cluster C for the AACB capacity building programme.

To enhance the water management competency of the business and industry cluster, it is recommended that KASA develops a policy in making this competency certification mandatory for businesses and industries. Through a star-rating system, KASA can monitor and track the adoption and implementation of the six-step principles which can create a long-term ripple effect for businesses and industries in accelerating IWRM implementation. The targeted participants are EHS and Sustainability Professionals from the business and industry cluster for whom the AACB capacity building programme will enlighten the implications of an illegal discharge and methods to conserve water supplied to their business and industry operations. For those professional practitioners accredited by professional bodies like Board of Engineers Malaysia (BEM), Malaysia Board of Technologists (MBOT), Malaysia Green Building Council (MGBC), Malaysian Institute of Architects (PAM), etc, it is also recommended for the Ministry of Human Resources (MoHR) and Human Resource Development Corporation (HRDF) to provide Continuing Professional Development (CPD) points to encourage the professional practitioners to be equipped with IWRM knowledge and skills.

This training module is expected to deliver the means of reducing cost and risk as well as improving compliance and revenue of businesses and industries by adopting the six-step principles as the action framework (Figure 2.2). Through this module, the business and industry sectors can create partnerships with local authorities and communities in co-managing river basins and good branding for their companies through CSR initiatives. Given the current COVID-19 condition, free training gives incentive for businesses and industries to participate in the AACB capacity building programme.

Figure 2.2 The 2C2R implications for business and industry in adopting circularity in water management

(ii) GOVERNANCE

The objective of the governance pillar is to strengthen the governance of the water sector at all levels. It is recommended for KASA to form a strategic partnership with businesses and industries and the Department of Environment (DOE) to establish a resource person directory within their regional network. Under this strategy, a public-private partnership will be formed between KASA and business and industry entities to roll out the AACB 'Training of Trainers' for the business and industry cluster whereby competent trainers trained under the AACB programme will be appointed as resource persons for their respective zones and/or regions. A directory of resource persons will be established and maintained by DOE and made available for public access so that businesses and industries can always refer and consult the resource persons of their respective zones and regions on the best management practices of water resources.

(iii) INFORMATION & RDCI

The objective of the information & RDCI pillar is to enhance data-driven decision-making for sustainability. Under this strategy, DOE will work with a communication team comprised of resource persons to publish and disseminate water best management practices in businesses and industries through public communications. The communication team will formulate a strategy on tracking and monitoring the effectiveness of the competency training as well as the behaviour of businesses and industries using communication strategy to help in getting the buy-in to promote the uptake of competency training. Furthermore, strategic communication also plays a role to promote star-rating as healthy brand competition which will further reinforce the values of IWRM. Short videos could be produced through competitions to promote awareness about water best management practices among the businesses and industries and easily disseminated to targeted groups through social media. Besides that, resource persons could assist their companies to report water management performance through sustainability reporting on environment, social and governance (ESG) initiatives. Through guarded-self-regulation, DOE and the Department of Drainage and Irrigation (DID) could work together to provide a checklist that takes into account IWRM aspects to facilitate businesses and industries to implement ESG beyond compliance.

(iv) FINANCE

The objective of the finance pillar is to strengthen financial capacity for water sector transformation. It is recommended for the Malaysian Investment Development Authority (MIDA) to introduce a new category in Green Incentives that are related to water management projects. This strategy aims to encourage more business and industry entities to adopt and implement water management projects such as water reuse and reclamation for non-portable purposes in their premises and operation sites. Any investments to enable business and industry entities to adopt these practices should be given tax incentives.

The Ministry of Finance (MoF) and the Inland Revenue Board of Malaysia (LHDN) should also give tax incentives to business and industry entities that successfully protect and upgrade the condition of their nearest water body whereby company tax exemption will be given to business and industry entities for their involvement and contribution in conserving water resources. To assist SMEs in adopting water best management practices, grants will be given as seed money to kick start the SMEs' IWRM initiatives. To recognise business and industry entities that succeed in applying water best management practices in their premises and operations, KASA is recommended to give the annual Water Sustainability Award as publicity for business and industry entities to improve their sustainability image.

(v) INFRASTRUCTURE & TECHNOLOGY

The objective of the infrastructure & technology pillar is to develop sustainable infrastructure with cost-effective technology. The infrastructure & technology pillar aims to set up one-stop training centres at the national and state levels in which DID will provide their existing training centres for the purpose.

3.0 Business and Industry in Malaysia

This chapter provides elementary participants with an overview of the landscape of business and industry sectors in Malaysia. The term "business" has a broad meaning. It refers to organisations or enterprising entities engaged in commercial, industrial or professional activities. Businesses can be for-profit entities or non-profit organisations that operate to fulfil a charitable mission or further social cause. An 'industry' is defined as a group of companies that are related based on their primary business activities and operations. In classifying industries, they are typically grouped into larger categories called sectors.

In AACB, the Business and Industry cluster is further classified into three sub-clusters as below:

| CLUSTER A | Bursa Saham Listed Companies |
|-----------|---|
| CLUSTER B | Industrial Parks/Halal Parks/Estate Parks |
| CLUSTER C | •Businesses and industries listed under SME Corp. |

3.1 Sectors

In Malaysia, different business and industry sectors are under the purview of different ministries. For example, the Ministry of International Trade and Industry (MITI) is responsible for planning, formulating and enforcing policies related to industrial development, international trade and investment. Besides increasing bilateral, multilateral and regional trade connections and collaborations, MITI also helps to stimulate foreign and domestic investments and promote Malaysia's manufacturing products and services exports. Meanwhile, the Ministry of Entrepreneur Development and Cooperatives (MEDAC) is responsible for coordinating the implementation of small and medium enterprise (SME) development programmes across all associated ministries and organisations. MEDAC serves as a primary point of reference for SMEs and entrepreneurs for research and data distribution, as well as providing business advising services to SMEs and entrepreneurs across the country. In Cluster A, there are 952 companies listed under Bursa Saham; Cluster B comprises of 247 Industrial Parks/Halal Parks/Estates Parks; and Cluster C has 5,652,560 establishments listed under SME Corp.

3.2 Bursa Malaysia Listed Companies

Bursa Malaysia is the stock exchange of Malaysia that was incorporated in 1976. As one of the largest bourses in ASEAN, Bursa Malaysia helps over 900 companies in Malaysia to raise capital across 50 economic activities through the Main Market for large-cap companies, the ACE Market for emerging companies of all sizes and the LEAP Market for up-and-coming SME companies. Table 3.1 shows the number of companies listed under Bursa Malaysia according to their industry and sector.

| No. | Industry | Sector | Total |
|-----|-------------------|-----------------------------------|-------|
| 1 | Commercial | Commercial Printing/Forms | 5 |

3.3 Industrial Parks/Halal Parks/Estate Parks

An industrial park is designed as a zone for industrial use rather than for residential or commercial needs. Industrial parks usually house oil refineries, ports, warehouses, distribution centres and factories. Businesses may even be offered tax incentives such as tax increment financing to set up their operations in some of these industrial parks. Most industrial parks in Malaysia are developed by government agencies such as the State Economic Development Corporations (SEDCs), the Regional Development Authorities (RDAs), port authorities and municipalities. The locations of industrial parks and halal parks in peninsular Malaysia are shown in Figure 3.1, and in Sabah and Sarawak in Figure 3.2.

Figure 3.1 Industrial parks and halal parks in peninsular Malaysia

3.4 Businesses and Industries Listed Under SME Corp.

Small and medium enterprises (SMEs) as well as microenterprises play an important role in helping to increase Malaysia's growth, employment and income. According to SME Corp, SMEs are important economic agents for Malaysia based on their GDP contribution of 35.9% in 2019, which was above the standard benchmark for a developing nation. According to the National SME Development Council, SMEs cover sectors in agriculture, construction, manufacturing, mining & quarrying and services (Table 3.2), and SMEs are defined in two ways as stated below and as illustrated in Figure 3.3:

- 1. For the manufacturing sector, SMEs are defined as firms with a sales turnover not exceeding RM50 million OR the number of full-time employees not exceeding 200.
- 2. For all other sectors, SMEs are defined as firms with a sales turnover not exceeding RM20 million OR the number of full-time employees not exceeding 75.

Figure 3.3 Detailed definition of SME categories, namely micro, small and medium (SME Corp, 2013)

Table 3.2 Total number of SMEs in the various sectors (Source: https://newss.statistics.gov.my/newssportalx/ep/epFreeDownloadContentSearch.seam?cid=1417929)

| No. | Sector | Number fo SME |
|-------|----------------------|---------------|
| 1 | Agriculture | 186,444 |
| 2 | Construction | 630,063 |
| 3 | Manufacturing | 1,039,662 |
| 4 | Mining and Quarrying | 20,674 |
| 5 | Services | 3,775,717 |
| Total | | 5,652,560 |

4.0 Water Management in Businesses and Industries

This chapter illustrates water management in business and industry sectors by providing an elementary background understanding about water consumption and wastewater generation, water-related policies, legal implications and economic incentives to accelerate IWRM implementation in Malaysia. The 2030 Agenda for Sustainable Development laid down a set of 17 interconnected global goals that are intended to serve as a roadmap to a better and more sustainable future for all. Sustainable Development Goal 6 (SDG 6) particularly aims to ensure availability and sustainable management of water and sanitation for all. SDG 6 has eight targets to be achieved by 2030 which include six "outcome-oriented" targets and two "means of achieving" targets:

| Target 6.1 | •Safe and affordable drinking water |
|--|--|
| •End open defecation and provide access to sani and hygiene | |
| Target 6.3 | Improve water quality, wastewater treatment and safe reuse |
| Target 6.4 | Increase water-use efficiency and ensure freshwater supplies |
| Target 6.5 | Implement IWRM |
| Target 6.6 | Protect and restore water-related ecosystems |
| Target 6.a | •Expand water and sanitation support to developing countries |
| Target 6.b | •Support local engagement in water and sanitation management |

Figure 4.1 SDG 6 and targets

4.1 Water Consumption vs Wastewater Generation

Businesses and industries entail a lot of processes, such as fabricating, processing, washing, diluting or transporting a product which involve water consumption and sanitation throughout product manufacturing and service provision. In Malaysia, the non-domestic metered water consumption has been increasing steadily whereby approximately 4.72 billion litres of metered water were consumed per day for non-domestic use in 2019. Figure 4.2 shows the non-domestic metered water consumption in Malaysia from 2012 to 2019. Some sectors use a large amount of water to produce their products such as food, paper, chemicals, refined petroleum or primary metals, and the water consumed by these business and industry entities may come from water operators supplying from the nearest water resource. Table 4.1 shows the water consumption volume according to sectors.

Figure 4.2 Non-Domestic Metered Water Consumption in Malaysia from 2012 To 2019

Table 4.1 Water Consumption Volume According to Sectors

| No. | Sector | Water Consumption (m ³) | | |
|-----|-------------------------|-------------------------------------|--|--|
| | Agriculture | | | |
| 1 | Oil Palm | 872,615 | | |
| 2 | Rubber | 10,635,080 | | |
| 3 | Livestock | 117,342 | | |
| 4 | Forestry & Logging | No data | | |
| 5 | Fisheries & Agriculture | 2,577,381 | | |
| 6 | Others | 1,537 | | |

| | Construction | | | |
|----------|---|------------|--|--|
| 7 | Civil Engineering | 5,290 | | |
| 8 | Residential Buildings | 418 | | |
| 9 | Non-Residential Buildings | No data | | |
| | Manufacturing | | | |
| 10 | Electrical & Electronics Products | 435,877 | | |
| 11 | Food, Beverages & Tobacco | 1,458,874 | | |
| 12 | Transport Equipment & Other Manufacturers | 115,493 | | |
| 13 | Petroleum, Chemical, Rubber & Plastic | 688,484 | | |
| 14 | Wood, Furniture, Paper Products & Printing | 10,580 | | |
| 15 | Non-metallic, Mineral Products, Basic Metal & Fabricated Metal Products | 3,076,000 | | |
| 16 | Textile, Wearing Apparel, Leather & Footwear | No data | | |
| | Mining and Quarrying | | | |
| 17 | Petroleum & Natural Gas | 37,060,000 | | |
| 18 | Mining (bauxite, gold, coal, iron ore, tin, ilmenite, amang retreatment & other mining) | 23,772 | | |
| 19 | Quarrying (granite, limestone, sand extraction & other stone) | 1,732 | | |
| Services | | | | |
| 20 | Wholesale & Retail Trade, Food & Beverages and Accommodation | 13,500 | | |
| 21 | Information & Communication and Transportation & Storage | 335,969 | | |
| 22 | Health, Education and Arts, Entertainment & Recreation | 495,000 | | |

According to the 2010 Census Report by the Department of Statistics, the estimated volume of wastewater generated by municipal and industrial sectors was 2.97 billion m³ per year. Figure 4.3 shows the proportion of population equivalent (PE) served by various sewerage systems. According to the main sewerage operator in Malaysia, Indah Water Konsortium, the dominant wastewater treatment types in Malaysia are preliminary (removal of rags, rubbish, grit, oil and grease), primary (removal of settleable and floatable materials) and secondary (biological treatment to remove organic and suspended solids). According to PRNewswire, the largest users of water treatment plants in Malaysia are from the agriculture and food sectors. Malaysians rely on agriculture as it is one of the three main standard pillars in the country's economy followed by the oil & gas industry where the rising demand for oil and oil-based products has increased the demand for water treatment in this industry. Malaysia has also emerged as an Electronics and Latex hub which further promotes large scale usage of high grade treated water in this industry. Textile, tannery, pharmaceuticals, automobile and electronics are some other key sectors that demand extensive water treatment. Table 4.2 shows the wastewater generation according to sectors.

Figure 4.3 Proportion of Population Equivalent (PE) Served by Various Sewerage Systems

| No. | Sector | Wastewater Generation (m ³) |
|-----|--|--|
| | Agriculture | No. |
| 1 | Oil Palm | 104,177 |
| 2 | Rubber | 2,277,850 |
| 3 | Livestock | 336,678 |
| 4 | Forestry & Logging | No data |
| 5 | Fisheries & Agriculture | 2,159,912 |
| 6 | Others | 756 |

| 16 | Textile, Wearing Apparel, Leather & Footwear | No data |
| | Mining and Quarrying | |
| 17 | Petroleum and Natural Gas | 154,000 |

Table 4.2 Wastewater Generation Volume According to Sectors

| 18 | Mining (bauxite, gold, coal, iron ore, tin, ilmenite, amang retreatment & other mining) | No data | | | |
|----------|---|---------|--|--|--|
| 19 | Quarrying (granite, limestone, sand extraction & other stone) | No data | | | |
| Services | | | | | |
| 20 | Wholesale & Retail Trade, Food & Beverages and Accommodation | No data | | | |
| 21 | Information & Communication and Transportation & Storage | 330,220 | | | |
| 22 | Health, Education and Arts, Entertainment & Recreation | 490,925 | | | |

Figure 4.2 shows the quadrant of water consumption and wastewater generation of different sectors in Malaysia. Petroleum & natural gas, rubber & plastic and oil palm sectors are the top three waterconsuming industries; however, petroleum & natural gas industries have better water efficiency with relatively lower wastewater generation. In contrast, fisheries & agriculture and rubber sectors have relatively lower water efficiency where the wastewater generations are as much as half of the water consumption or more. In this context, there is a need to implement IWRM to ensure the sustainability of water resources in Malaysia.

4.2 Water-related Policies, Legal Implications and Economic Incentives for Business and Industry

(i) Policies

The Malaysian government has introduced several water-related policies to direct water resources management in the country (see Figure 4.3). The National Water Resources Policy (NWRP) 2012 which is laid out based on the IWRM approach emphasises that the security and sustainability of water resources shall be made a national priority to ensure adequate and safe water for all through sustainable use, conservation and effective management of water resources and enabled by a mechanism of a shared partnership involving all stakeholders. The NWRP is intended to serve as a directional focal point to help bring together stakeholders including government agencies, nongovernment organisations, academia, research institutions, the private sector and communities to help translate the strategic plans into actions. The 2009 National Policy on Climate Change helps to ensure climate-resilient development to fulfil national aspirations for sustainable development in which one of the principles focuses on strengthening the implementation of climate change actions that contribute to environmental conservation and sustainable use of natural resources that includes water. The 2009 National Green Technology Policy identifies green technology as a driver to accelerate the national economy, promote sustainable development, and promote technology in the management and utilisation of water resources and wastewater treatment. The 2016 National Integrated Water Resources Management Plan aims to infuse IWRM principles and practices into the planning and management operations. The 2017 Green Technology Master Plan provides a strategic framework and roadmap for the green initiative and programmes in Malaysia, and water has been identified as one of the sectors in which the policy aims to achieve the targets as shown in Figure 4.4. In the context of water management, green technology plays a significant role to bridge multiple mandates and policy directions as business and industry can harness the potential of green technology in the IWRM.

Figure 4.3 Policies that are related to water management in Malaysia

(ii) Legal Implications

Besides policies, several legislations have also been enacted to address the issue of water pollution in Malaysia such as the Water Services Industry Act 2006, the Environmental Quality Act 1974 and the Penal Code with the respective provisions:

- Section 61(1) of the Water Services Industry Act 2006 prescribes that anyone who allows effluent or noxious matter into the public sewer shall be liable to a fine not exceeding RM100,000.00 or to imprisonment for a term not exceeding one year or to both.
- Section 121(1) of the Water Services Industry Act 2006 states that those who contaminate or cause the contamination of a water supply with the intention to cause death, knowing that it could likely cause death or that it would endanger lives, can be sentenced to death if someone dies as a result.
- Section 25(3) of the Environment Quality Act 1974 prescribes that any person emitting, discharging or depositing any environmentally hazardous substances, pollutants or wastes into any inland water shall be liable to a fine not more than RM100,000 or imprisonment of not more than five years or both.
- Section 34B(4) of the Environmental Quality Act 1974 provides that any person found to have been polluting waters shall be liable to a fine not exceeding RM500,000 or to imprisonment for a period not exceeding five years or to both.
- Section 430 of the Penal Code provides for a much severe punishment whereby an accused, if found guilty, will be facing imprisonment term of between 5 to 30 years or a fine or both.

(ii) Economic Incentives

To assist the implementation of water management initiatives in business and industry, the Malaysian Green Technology Corporation provides Green Technology Financing Schemes to empower green business and industry in which water is one of the sectors covered in this scheme (Figure 4.5). The financing scheme offers businesses and industries an opportunity to adopt green technology in the management and utilisation of water resources which covers better quality of water supply to users, efficient use of water resource, rainwater harvesting, recycling & reuse, reduced use of chemicals, use of green materials and/or equipment.

4.3 Integrated Water Resources Management (IWRM) in Business and Industry

A 'business-as-usual' approach is no longer sustainable. Business and industry shall lead the change to mitigate the significant environmental, social, and economic losses. Failing to manage water effectively will cause serious impacts on biodiversity, freshwater availability, climate action and human health. Integrated water resources management (IWRM) has been commonly cited and accepted as the foundational principle in water management. The 2000 Global Water Partnership defines IWRM as a process that promotes the coordinated development and management of water, land and related resources to maximise economic and social welfare in an equitable manner without compromising the sustainability of vital ecosystems.

As noted by Hassing et al. (2009), instituting IWRM, like many major institutional changes, takes time because the processes required to adapt to existing institutions and build the capacity of new ones are complex. In tracking the progress towards IWRM, business and industry entities generally need to work hand-in-hand with the development of the national governance structure and roll out water resources management initiatives with their stakeholders along the value chain. This is because water management is a system-based issue that requires a systemic solution. Since business and industry are not particularly adept at this, they tend to focus on their system or whatever is in front of them at the time. Of course, businesses and industries do not own the system, but it does not prevent them from engaging with the government to push for appropriate water sector reform.

Business and industry sectors as a vital stakeholder and economic engine have been historically underrepresented in the IWRM conversation and the work plans of those agencies leading the

development of IWRM. The challenge that remains, however, is to take global, local and locally desired development goals and translate those into business opportunities as much as risk reduction. Hence, how business and industry can support IWRM initiatives (at the basin scale) while also benefitting businesses is essential to secure future water rights where different stakeholders along the value chain can organise themselves around their shared interests and mobilise to identify and solve water problems and invest in water opportunities. In this context, IWRM as a broader policy framework provides these stakeholders with a platform to function and contribute to water resource management.

5.0 Paradigm Shift in Water Management

This chapter aims to provide intermediate participants with the concepts that need to be adopted for shifting the paradigm in water management where the participants are hoped to advocate for transformation in their management practices. Securing water quantity and quality has been one of the world's most significant challenges today where worldwide demand for water increases with the expansion of population, urbanisation, and economic development. It is exacerbated by climate change where it is projected that by 2030 the global water demand will increase by 50% and water demand will outstrip supply by 40% if the path of 'business-as-usual' were to be continued. Water issue affects the present and future generations and has significant implications on business and industry, society, and the environment, in which business and industry entities in resource-constrained areas are likely to be the most impacted in terms of water allocation. Hence, business and industry have an important role in addressing water challenges whereby a paradigm shift in water management is urgently needed.

5.1 Commodity vs Resource

Determining the 'value' of water whether it is a commodity or resource entails more than just estimating its true cost whereby the concept of 'value' looks into externalities such as pollution, to understand and manage impacts and dependencies on watersheds and how these impacts and dependencies interact with societies and economies. Water valuation determines the value of water to various stakeholders under different circumstances such as structures & processes, environmental functions and human benefits as shown in Figure 5.1. The WBCSD Business Guide to Water Valuation (<u>https://www.wbcsd.org/Programs/Food-and-Nature/Water/Resources/Business-Guide-to-Water-Valuation-an-introduction-to-concepts-and-techniques</u>) provides a guide to determine prices, costs and values for six water-related dependencies and consequences. The process is currently difficult and needs to be simplified. Until then, water costing methods can be used to assess the potential for water reduction, reuse, and recycling.

Figure 5.1 Human-based values (Commodity vs Resource) (Source:

https://www.yumpu.com/en/document/read/42536671/a-commodity-a-resource-pdf-waterresources-board-state-of-)

5.2 Abundant vs Limited

Water exists in various forms, and it is constantly moving on above and below the Earth's surface through the 'water cycle'. The water mass on Earth is constant over time; however, it depends on a wide range of fluctuating climatic variables such as ice partitioning, the amount of freshwater, saline water, and atmospheric water. Figure 5.2 shows the water cycle depicting annual renewable water supply per person per basin (m³) whereby evaporation, condensation, precipitation, infiltration, runoff and subsurface flow are all ways that water moves. These processes are dependent on the climate variation wherein according to the Intergovernmental Panel on Climate Change (IPCC), if current trends continue, temperatures may rise by 3.7 to 4.7 °C by 2100 (IPCC 2014). Under such circumstances, climate change will have a substantial impact on the water cycle, thus affecting the availability of water.

Business and industry entities all rely heavily on water, and this reliance on water, to some extent, can have either a positive or negative impact. Negatively, business and industry entities can cause water pollution, whereas positively, businesses and industries could contribute to improved water quality. While impacts are often assessed, some business and industry entities fail to understand the link between their reliance on water in industrial operations and the environmental impact. Understanding the connections between business and water can enable better water management.

Business and industry entities are major water users amounting to 10% and 57% of total water consumption in Asia and in Europe, respectively. Hence, a shift of consumption pattern is required considering that water is a finite resource. According to the benchmark data from several industries, businesses and industries can reduce their water consumptions by up to 50% (Andrews et al., 2011). Addressing water use is critically needed for business and industry entities to contribute to water security in the watersheds where they operate in which IWRM offers circular water management within the ecological limit.

5.3 Infinite Growth vs Ecological Limits

As shown in Figure 5.3, watersheds are critical to regional water supplies because they capture and store rainfall, maintain and control river flows and recharge groundwater reservoirs. Healthy watersheds provide reliable water supplies whereby groundwater, surface water and municipal drinking water systems are sources of water to all sectors of businesses and industries as well as to the communities. The water needs to be treated to bring it up to the requisite quality for business and industry operations (e.g., cooling towers, boilers, etc.). Wastewater produced is either discharged directly or recycled after on-site treatment. The way businesses and industries deal with water will impact not only the local environment but also on the ecological limits. Therefore, business and industry entities should work across sectors and involve other water users in the watersheds in which they operate to improve water security and risk mitigation.

Figure 5.3 Link between business and water (Source: WBCSD, 2012)

5.4 Waste vs Conservation

According to Rodriguez (2018), more than 80% of the wastewater generated by society is currently discharged to the environment without treatment or recycling, and this has a major implication on the health of the ecosystem health and society (Figure 5.4). The way water and its services are traditionally managed is not sustainable whereby the investment planning, design and operating models of water extraction, treatment, usage and the subsequent wastewater discharge back into water bodies are linear in nature. Hence, a shift from a linear approach to a circular water management is needed to

lower the consumption of water and promote the 5Rs (Reduce, Reuse, Recycle, Restore and Recover). To foster a paradigm shift from a linear economy towards a circular economy, wastewater should no longer be considered as a problem but as a solution that may contribute to the provision of sustainable infrastructure services, improving operators' financial viability and the quality of the environment, and reinforce the systems' resilience.

Figure 5.4 From waste to resource (Source: Diego Juan Rodriguez (2018) (https://blogs.worldbank.org/water/wastewater-treatment-critical-component-circular-economy)

5.5 Low vs High Cost

Table 5.1 shows the list of water tariffs in respective states of Malaysia, ranging from RM 0.84 to RM 3.30, based on the consumption block. As compared with other countries in the region (see Table 5.2), the Malaysian commercial water tariff is still cheap, posing a substantial obstacle to more efficient water use throughout the lifecycle of business and industry entities. The treatment cost for sewage services in Malaysia is relatively cheap compared to other countries in the region where, as Table 5.3 shows, premises receiving individual septic tanks services and premises with connected sewerage services are only charged RM 2.00 per head per month and RM 2.50 per head per month, respectively.

The overall cost of water management differs significantly from the tariff of water when considering the cost of water throughout the entire water management cycle (intake, storage, transport, various treatments, disposal, energy, chemicals, etc.). As a result, the investment in proper water management systems is often deemed not viable because the return on investment (ROI) is frequently underestimated. Hence, the investments of business and industry entities on water infrastructure need to take into account water-related expenditures within the fence, including direct and indirect costs associated with water management, the true value of water within the fence, which includes

water-related risks (e.g., the lack of sufficient water for production) and water value which includes all of the above as well as monetisation of water by other watershed users.

As shown in Figure 5.5, the overall cost of water covers perceived and other costs. Most business and industry entities more often than not only take into account the perceived cost, but they seldom take into account the "other" costs which include associated expenditures with water use such as energy costs for transporting water, labour costs to manage water systems, regulatory costs, the costs of chemicals for pre-treating water to be used in industrial processes, and the costs of treating watewater (capital equipment and operating costs) before discharge. As a result, businesses and industries undervalue the impact of water costs on their operations. Furthermore, business and industry entities also miss out on the opportunities to reduce operating expenses by carefully managing their water. Reducing water use, reusing water and recycling wastewater are crucial considerations rather than optional voluntary actions for business and industry entities when addressing total water expenses.

5.6 Environmental Impact vs Business Risk

Making sound policy decisions for environment conservation and improving water stewardship is essential in managing business risks, for instance, in minimising risks related to water supplies with a negative impact on the environment. Business and industry entities can address current and future business risks caused by climate change and environmental pollution by implementing efficient use of water, allocating water to high value uses and shifting to more sustainable management practices. Policies and investments that can assist business and industry entities in mitigating environmental impacts include planning the allocation of water resources, providing clear guidelines on water quality, adopting incentives to increase water efficiency, and investing in infrastructure to secure water supplies.

Risks associated with water affect every area of business and industry, either directly or indirectly. As water is essential in the manufacturing and delivery of products, mismanagement of water poses a threat to almost all businesses. Veolia created 'The True Cost of Water', an economic evaluation tool based on the risk and benefits of reducing, reusing, and recycling water. Aside from direct and indirect expenses, the tool accounts for costs associated with risks (Figure 5.6) such as risks to operations (e.g., water shortages, flooding), financial and regulatory risks, and reputational risks (e.g., temporary loss of operating licence). Businesses and industries can mitigate risks related to water by taking the 5Rs approach, i.e., reduce, reuse, recycle, restore, and recover, when developing a water management strategy. The 5Rs approach ensures that all opportunities to mitigate water-related risks are identified and acted upon to secure business operating licenses.

during the analysis. Each risk is plotted on a graph based on its probability and potential economic impact.

Figure 5.6 The True Cost of Water tool looks at the financial implications of water-related risks Adapted from The True Cost of Water, 2014, Veolia (Source: WBCSD, 2017)

5.7 Inside the Fenceline vs Watershed

The Natural Capital Protocol (<u>https://capitalscoalition.org/capitals-approach/natural-capital-protocol/?fwp_filter_tabs=guide_supplement</u>) provides a framework for identifying, quantifying (e.g., amounts, extents) and assessing (e.g., relative importance, worth) direct and indirect (negative or positive) impacts on business and industry activities as well as reliance on the water by business and industry entities. Understanding the true costs of water in business and industry processes inside the fenceline is critical to reducing, reusing and recycling water. Considering the value of water and the associated risks improves the chances of success in monetising water as a resource for other users, thus making water recycling more viable.

The location of the local water source (upstream/downstream) also affects the cost of water. Figure 5.7 shows how water consumers interact with one another within the fenceline whereby water becomes one of the significant aspects to be considered when a company is one of the top water consumers within the watershed. Therefore, the costs that should be taken into account include the cost of infrastructure to reduce, reuse and recycle water, the cost of operational controls to optimise water conservation, the cost of operation and maintenance to maintain water reductions, and the cost of implementation and follow up (including regulatory).

Figure 5.7 Costs of water inside the fence, the value of water outside the fence (including externalities), based on the impacts and dependencies of water Source: Natural Capital Protocol (Source: WBCSD, 2017)

5.8 Operations vs Value Chain

In accelerating IWRM implementation in business and industry sectors, a paradigm shift that takes into account water risks throughout the value chain, which encompasses the upstream supply chain, operations and downstream product consumption, is needed. As explained by Moore (1993), successful businesses are those that evolve rapidly and effectively. Yet innovative businesses cannot evolve in a vacuum. They must attract resources of all sorts, drawing in capital, partners, suppliers, and customers to create cooperative networks. A company is viewed not as a member of a single industry but as part of a business ecosystem that crosses a variety of industries. In a business ecosystem, companies co-evolve capabilities around an innovation whereby they work cooperatively and competitively to support new products, satisfy customer needs, and eventually incorporate the next round of innovations.

In the context of water, 'collective action' has long been recognised as an important component in addressing complicated water challenges, such as access to safe water, sanitation, and hygiene, that is essentially an ecosystem of stakeholders as shown in Figure 5.8. Figure 5.9 illustrates the transformation from linear supply chains to complex, dynamic and connected value webs, comprising stakeholders coming together to address water challenges. Traditional supply chains are likewise undergoing this transformation from value chains to business ecosystems where the traditional supply chains focusing on operations are replaced by 'value webs' of stakeholders that deliver items from suppliers to consumers. As water is central to the business and industry sectors, the paradigm shift to business ecosystems and 'value webs' from traditional business and industry operations provide a new opportunity for the stakeholders to mobilise resources collectively to address water-related risks affecting business growth, economic development, and social wellbeing.

6.0 Action Framework

This chapter lays out the six-step principles as the action framework to be adopted by advanced participants and guides the participants to adopt the principles in their organisations. Sustainable water management is essential for the continuity of business and industry operations, especially when the cost of 'business as usual', such as the cost of action in addressing issues like pollution, is far more significant. In realising SDG 6, WBCSD has laid down an action framework to guide business and industry entities in acting responsibly and sustainably in managing their water resources. This undertaking can reduce physical, regulatory and reputational risks of business and industry entities and become a benchmark in the market whereby improving water management performance can also help in answering environmental, social and economic challenges.

Business and industry entities often underestimate the risks of pollution as well as externalities of their operations where it could be of burden to other stakeholders. Ineffective management of wastewater will cause significant risk to business whereby it will affect the value chain partners downstream. Hence, business and industry entities need to go beyond their business scope to adequately assess and manage the risks. A paradigm shift in managing water resources is therefore needed to flip the current water management practices towards a sustainable one.

The action framework covers the following six steps to be focused on by business and industry entities:

To realise IWRM, business and industry entities should collaborate to develop standardised and transparent mechanisms at the sector and industry clusters, and basin levels that would build a shared vision and monitor progress. Engagement with various stakeholders, i.e., public authorities, communities, and academia, is critical to establish an enabling environment that offers incentives for investments in water infrastructures that safeguard public health and the environment cost-effectively.

6.1 Incorporate Principles of Circularity Across Operations

The principles of circularity improve resilience towards water scarcity, optimise cost and ensure the continuity of the operations. The 5Rs approach — reduce, reuse, recycle, restore, and recover — are key 'fit-for-purpose' practices to incorporate circularity in water consumption that involves the treatment of wastewater to quality that is suitable for its intended use while at the same time giving the least risk to the user. Moreover, this approach allows business and industry entities to overcome constraints such as lack of capital, technology, and skilled manpower that are required to process wastewater to the required quality for their next intended applications. Business and industry entities shall first incorporate the principles of circularity in their business processes and operations (Figure 6.1), applying water management solutions through:

Reduce – Reduce water losses and increase water efficiency by relooking into the in-house water consumption and wastewater generation patterns through water supply and wastewater treatment system designs. Lower wastewater generation by increasing water-consumption efficiency or substituting materials or minimising the use of hazardous chemicals in business and industry processes. Reuse – Reuse water, with minimal or no treatment, within and outside the fence for one or more processes as well as ensure wastewater and resources are safely reused.

Recycle – Recycle wastewater within and outside the fence by implementing closed-loop processes and creating by-product synergies between industries and other sectors.

Restore – Return water to the original source at a similar or better quality than when it was taken. Recover – Retrieve resources (other than water) from wastewater to be (re)used.

Figure 6.1 Circularity in water management (Source: WBCSD, 2017)

6.2 Establish Targets and Metrics Based on Science and Context

Regulatory standards set the monitoring requirements where business and industry entities most likely use compliance as a target proxy. However, such an approach might not lead to adequate action to prevent pollution of freshwater or increase recycling and reuse of wastewater. Business and industry entities should set targets for the scientific and environment-specific condition of freshwater and biodiversity, and effluent quality should be improved beyond compliance.

In this context, science-based targets outline how much and how rapidly business and industry entities need to reduce specific environmental impacts and dependencies. Science-based targets should be set to limit pollution by wastewater. The water circularity at the site can be measured through water sourcing, consumption, and discharge as contributions to a net reduction in water demand within the basin. These targets and metrics go beyond effluent quality and can lead to decisions that promote the recycling and reuse of wastewater.

6.3 Invest in Public and Private Sector Partnerships

Enhanced access to technological knowledge, compliance, financing, and influence are some of the incentives for collaboration whereby partnerships span from infrastructure sharing to collaboration with partners in the sector to form a knowledge-sharing consortium. Proactive action to improve wastewater management should be taken in conjunction with the public sector in identifying ways of using current wastewater treatment capabilities.

Public-private partnership (PPP) models for industrial wastewater is generally based on the basic notion that municipal wastewater treatment plants or utilities may provide the business and industry entities with treated wastewater. Such models could take a bilateral approach, with public and private companies trying to resolve a common problem, or a multilateral approach, where various institutions and groups develop a common solution. Figure 6.2 shows a joint venture between Air Selangor and Indah Water Konsortium to recycle wastewater for industrial use.

RECYCLING INITIATIVE

AIR SELANGOR, IWK IN WATER TIE-UP

SPV to produce non-potable treated water for distribution to industrial businesses

FARAH ADILLA KUALA LUMPUR bt@nst.com.my

PENGURUSAN Air Selan-gor Sdn Bhd and Indah Water Konsortium Sdn Bhd (IWK) have teamed up to embark on a sustainable water recycling initiative. The collaboration supported

The collaboration, supported the Environment and Water

by the Environment and Water Ministry and the National Water Services Commission, brings to-gether the country's largest water service provider and the national sewerage company. The initiative will be carried out by Central Water Reclamation Sdn Bhd, a special purpose ve-hicle (SPV) that is 60 per cent owned by Air Selangor and the rest by IWK. The agreements, as well as a

rest by IWK. The agreements, as well as a cooperation letter, were signed at a ceremony yesterday, witnessed by Environment and Water Min-ister Datuk Seri Tuan Ibrahim Tuan Man and Selangor Menteri Besar Datuk Seri Amirudin Shari. IWK said treated bio-effluent from its reatment floats would

from its treatment plants would be chanelled to Central Water for

further treatment.

further treatment. The SPV's plant will produce non-potable treated water that will be distributed by Air Selan-gor through a dedicated pipe net-work to industrial businesses. Central Water's maiden project will be to operate a reclaimed wa-ter treatment plant in Setia Alam, Selangor, that can produce four million litres per day (MLD) of non-potable treated water with

non-potable treated water with

IndahWater **Air Selangor** million litre's per day (MLD) of non-potable treated water with plans to subsequently increase the capacity to 7.5 MLD. The companies said the collab-oration would pave the way for the development of reclaimed water use in Selangor, Kuala Lumpur and Putrajaya. Apart from the Setia Alam plant, Air Selangor and IWK have identified other collaboration op-portunities in respect of IWK reatment plants, including the plants at Pantai 2, Kuala Lumpur and Seksyer 23, Shah Alam. "This collaboration will opti-mise the nation's available water resources while protecting the environment, and highlights the environment, and highlights able development of Malaysia's

6.4 Support and Incentivise Value Chain Performance

Business and industry entities collaborate with upstream and downstream partners in the value chain and incentivise them to adopt best management practices in the conservation of water, treatment of wastewater, reuse, and safe release of effluent. An integrated approach to minimise the release of hazardous chemicals is an excellent example of business and industry to prevent pollution and assure a safer production.

Most major companies have a supplier code of conduct that incorporates expectations for water management constituting part of the criteria for regular screening or assessing suppliers that is supported by corrective action and capacity-building. The capacity and the competence of people operating wastewater treatment plants and technologies are the major challenges in water management. Companies should assist capacity building activities in different business and industry entities and value chain partners including the implementation of uniform training and certification programmes.

6.5 Value Water to Minimise Negative Externalities and Incentivise Reuse

As a resource, the value of water differs from that of water prices and costs. During the assessment of water costs, the economic, social, and environmental effects of water as well as its dependence should be considered. Assessment of water can have three main influences on the management of the business and industrial water and wastewater: lowering the consumption of freshwater, limiting the release of hazardous material into freshwater sources, and promoting wastewater reuse and recycling.

Understanding the value of water in a basin setting can lead to the understanding of how water contamination has a detrimental effect on society, the environment, and the economy. Applying methodologies such as the Natural Capital Protocol will improve our understanding of the detrimental effects of freshwater contamination when analysing the cost-benefit of various investments.

In many regions, there is no financial incentive for wastewater reuse and recycling mainly due to the very low water tariffs. To make the reuse and recycling of water attractive in the long run, business and industry entities should assess the values of the added benefits of ensuring supplies, and the reduced environmental and social impacts resulting from the reduction of freshwater abstraction. These values should be used as variables to determine water prices for industries.

6.6 Improve Disclosure Beyond Compliance

Only 10% of corporations reported water-related risks in the 2019 CDP Global Water Report. As the freshwater contamination risk is widespread and interrelated, and its potential is significantly negatively affected by socio-economic growth and environmental integrity, all enterprises are required to report these risks.

The small percentage of companies reporting water contamination risks can be due to the risk of regulatory fines and sanctions, which are minimal and financially inconsequential, associated with freshwater pollution. The impact of freshwater contamination should be understood by business and industry entities not only within their activities and assets but also downstream and throughout the entire value chain. This is most significant because freshwater contamination can compromise the

water supply. Integrated water resource management and integration into the supply chain have, therefore, become essential ways to understanding the risk profile of the business and industry entities and to fully capture the impact of freshwater contamination.

Water and Effluents Standard 303 of the Global Reports Initiative (GRI) (Figure 6.4) gives explicit guidelines for business and industry entities on what should be reported for wastewater including information relating to water interactions as a shared resource, water discharge effect management, and water discharge.

Figure 6.4 Water and Effluents Standard 303 of the Global Reports Initiative (GRI) (Source: https://www.3blmedia.com/News/Five-Things-You-Need-Know-About-Updated-GRI-Water-Standard)

7.0 Case Studies (Sectors)

This chapter showcases the water best management practices taking place in business and industry sectors that provide a benchmark for advanced participants to emulate when they return to their organisations. There are several key success factors highlighted by WBCSD as shown in Figure 7.1. To succeed in implementing IWRM in business and industry entities, the primary factor is the support of top management whereby the success of water reduction, reuse and recycling initiatives require effective communication with the internal and external stakeholders convincing them about the value of water.

In implementing IWRM in business and industry entities, it is essential to integrate the principles of circularity in water management (5Rs approach) whereby all variables are open and the adjustments relating to sustainability can be most beneficially integrated. A flexible approach in considering alternatives is a starting point to ensuring a good return on investment (ROI) and a reduction in operational expenditure (OPEX). Instead of adding the design at the end of the unit operation processes, sustainability begins at the conceptual stage of the rollout. For instance, a wastewater plant can be constructed as a treatment facility for recycling water or bolt-on connections for future wastewater treatment modules.

A change in perception of the value of wastewater and the economics of water relies on the shift from concerns of cost, value, and human resources to recognition of potential value, savings, and revenues in which product energy recovery and wastewater chemicals can also generate values. To attain the change of the value of wastewater, due diligence in monitoring water-consumption-related performance can lead to realising effective and sustainable wastewater recycling. In decision making and systems design, tools such as water balances and water maps aid key performance indicators in supporting decision making and prioritisation through understanding the connection between water and process economies. It is essential to understand, acknowledge and act on the existing water footprint whereby performance data must also be disseminated internally as well as externally.

The choice of treatment that provides water with suitable quality for the purpose it is to be used is an essential factor whereby 'fit-for-purpose' treatment is necessary for the recycling of water. To attain 'fit-to-purpose' treatment, the guidelines specifying the quality of water for each type of application need to achieve separation and application of several treatments that satisfy the quality of final applications as well as explore 'fit-for-purpose' water quality standards, supporting the recovery of resources, and providing incentives for deploying technology in ensuring efficient water consumption and wastewater treatment.

Business and industry entities share the same water sources with other regional consumers; therefore, they should also be responsible for water resources conservation. Business and industry entities must take into account the interest of other users when assessing where water should be abstracted from a basin and examining recycled water sinks (for example, feeding recycled water into a river, reservoir or groundwater aquifer). Good basin governance can only be achievable if good relationships have been created between water boards and water companies. Other users' knowledge and insights on the water balance in a basin will help to establish a well-thought-out IWRM in the area. The following section showcases water best management practices in the sectors of agriculture, construction, manufacturing, mining, and quarrying, and services according to the six principles laid down in the action framework.

7.1 Agriculture

7.1.1 Oil Palm

| | Ś | | b Col | |
|-----------|---|--|-------|--|
| IOI GROUP | | | | |

IOI Plantation has installed water alarm and level detectors at the palm oil refinery effluent ("PORE") treatment plants to alert the operators whenever there are any malfunctions or when the level of the recycled water supply goes low. They have also adopted eco-themed oleochemical processes that use physical separation instead of chemical treatment to reduce the use of water. Their plantation is also equipped with a rainwater harvesting system where rainwater is collected to refill water for cooling and non-critical housekeeping purposes. IOI Plantation has also invested in the tertiary treatment system, such as reverse osmosis (RO) treatment plant to treat wastewater and reject water from the cogeneration plants to supply clean RO water for cooling towers. In terms of smart partnership and capacity building, IOI Plantation has collaborated with industry experts to share information and address challenges through social and environmental projects, partnerships, and associations, such as Proforest, Earthworm Foundation, Aidenvironment, Global Environment Centre, MPOA, Sustainable Palm Oil Choice Member and International Sustainability & Carbon Certification (ISCC). To ensure IOI Plantation always aligns with the latest industry's best practices, it has been part of their commitment (Table 7.1 and Figure 7.1) towards transparency for concerned stakeholders via third party verification by participating in a few programmes and training, such as Dow Jones Sustainability Indices, FTSE4Good Bursa Malaysia Index and Training on Social Impact Assessment.

IOI Plantation manages water by enforcing these measures and practices:

- 1. Installing water-gate at strategic locations along the main and collection drains to keep the water table at an optimum level.
- 2. Maintaining the optimum level of water to counter potential shortfall and risk of fire.
- 3. Maintaining riparian reserves to minimise soil run-off. Riparian reserves also serve as a filtration system to preserve the quality of water entering the waterways.
- 4. Planting legume cover crops as a soil conservation measure to prevent run-off into the waterways and avoid any planting on steep terrain.
- 5. Monitoring and treating all palm oil mill effluent (POME) and wastewater before discharging into the natural waterways. The treated POME will be used for land application.

| | Target | | Approach |
|---|--|---|--|
| • | 100% treated POME for upcycling use for | • | Green initiatives in resource-based |
| | oil palm plantation operations. | | manufacturing to increase water recycling, |
| • | Minimise pollution and waste generation. | | reduce wastage and increase reprocessing |
| | | | waste material and energy efficiency. |

Table 7.1 Target and Approach Used in IOI Plantation

7.1.2 Rubber

| FGV | | | S. | |
|-----|--|--|----|--|
| | | | | |

FGV Holdings Berhad manages water as an important aspect in their rubber plantation whereby they monitor their impacts on water systems closely as most of their water supply is extracted from nearby rivers. Their operations are located in 135 significant river systems in which many of them are monitored regularly to identify if there is any deterioration of water quality. Besides, all water discharged from their mills will undergo treatment to ensure the Biochemical Oxygen Demand (BOD) meets the regulatory standard. As for water monitoring, samples are taken every month and sent to an accredited laboratory for quality testing. FGV advocates for the responsible use of pesticides, herbicides and fertilisers and the use of chemicals remains the least preferred option whereby they optimise their chemical usage to ensure minimum impact on the environment while ensuring maximum profitability and taking into consideration the leaf and soil nutrient status. As for the capacity building, competency training and awareness related to sustainability and certification are given to their employees to ensure continuous improvement of FGV operations in the aspect of the environment. FGV has undertaken a socialisation programme to raise awareness and understanding of FGV's sustainability commitments (Figure 7.2) among FGV's operations, subsidiaries, suppliers and contractors whereby FGV has embedded sustainability into operations by enhancing job descriptions to create a working culture that complies with sustainability aspects.

Figure 7.2 Relevant SDGs that are Aligned with FGV's Commitments

7.1.3 Livestock

| QL | | | b Col | |
|------------------|--|--|-------|--|
| Resources Berhad | | | | |

QL Resources Berhad is an integrated agro-based business group, producing nourishing products from agricultural resources in Integrated Livestock Farming. As an agriculture processing industry, QL Resources Berhad can be a major producer of wastewater particularly organic waste with high biochemical oxygen demand resulting in low oxygen levels or even anoxic conditions in natural water. QL Resource Berhad applies best practices for data monitoring to ensure that wastewater discharged follows the Department of Environment's requirements, including, but not limited to, Biochemical Oxygen Demand (BOD), Chemical Oxygen Demand (COD), Suspended Solids, and Oil & Grease. As QL Resources Berhad starts to track their water withdrawal, the company analyses all collected data in greater detail to consolidate an action plan to reduce water withdrawal. QL Resources Berhad has also added biodiversity and water security into their materiality matrix (Figure 7.3).

| Material Matters Acr | ross 3 Themes | ILF |

Figure 7.3 Mapping of Material Sustainability Matters Across the Three Themes

7.1.4 Fisheries & Agriculture

| \wedge | | | |
|----------|--|--|--|
| MSM | | | |

MSM Malaysia Holdings Berhad reduces waste by equipping their manufacturing line with cuttingedge nano-filtration waste treatment systems that is able to process the discharge produced in their refineries. The resulting salt residue can be reused for resin regeneration while the rest of the residue is filtered and cleaned before being discharged. Waste stream management is outsourced to a supplier licensed by the Department of Environment to collect, transport, process and dispose of the waste following the local regulations and standards. As vast water quantities are used in the sugar refinery process, sustainable water management measures have been adopted to ensure the efficiency of water usage within their operations. The amount of water used and reused in their daily operations are constantly measured and monitored (Figure 7.4). For example, water consumption in MSM Johor has been reduced for FY2020 due to a process improvement activity.

Figure 7.4 Sustainability Achievement

7.2 Construction

7.2.1 Civil Engineering

| | Ŵ | | 600 | |
|---------|---|--|-----|--|
| SUNRISE | | | | |

UEM SUNRISE consider the environment in their projects as they work with experts to incorporate designs that have elements that help reduce water consumption by reusing the building materials wherever possible (Table 7.2). During the construction phase, they use a systematic monitoring system to measure wastewater discharge to minimise and control the potential impact that construction activities have on the environment and nearby communities. For buildings design, they put watersaving wares and fittings and use a rainwater harvesting system in bathrooms for toilet flushing. To minimise the impact of construction and operational activities on water quality, they regularly monitor discharge at project sites, such as diesel, oil, paint, solvents, cleaners, other harmful chemicals, construction debris, and dirt. UEM measure Total Suspended Solids (TSS) monthly to ensure that they do not exceed the water quality standards set by the National Water Quality Standard of Malaysia (NWQS). As for supply chain partners, UEM make sure that all their business partners commit to these matters:

- Generate minimal levels of pollution.
- Consume resources, such as raw materials, energy, and water efficiently.
- Practise environmental conservation and conserve biodiversity.

7.2.2 Residential Buildings

| FCOW/OPLD | | | b Col | |
|-----------|--|--|-------|--|
| | | | | |

EcoWORLD believes that by embedding green design and installing green features into its properties, it can reduce environmental impacts after its buildings have been occupied. EcoWORLD's construction concept include features such as recycled water sources for landscaping which reduces the usage of clean tap water, minimal earthwork cut and fill, water-efficient fittings or devices used to reduce water usage within the development, and rainwater harvesting systems. To ensure it continues to operate within permissible regulatory limits, its developments are subject to regular environmental monitoring by external consultants. Through monitoring activities, EcoWORLD evaluates the impacts on water quality and by using the results obtained, it follows the regulatory requirements by developing measures to limit the environmental impacts. Sustainable procurement policy is applied to all procurement activities undertaken to encourage EcoWORLD's partners to provide solutions, materials and goods that are eco-friendly. Under this policy, EcoWORLD recommends product specification requirements such as Programme for the Endorsement of Forest Certification and Forest Stewardship Council. This policy is circulated to all partners and employees to ensure all parties fully understand the requirements and wherever possible, create more discussions about promoting sustainable options in their business practices (Figure 7.5).

site management and practices, and construction methodologies.

in all EcoWorld developments.

7.2.3 Non-Residential Buildings

| AME | | | b Co | |
|-----------------------------|--|--|------|--|
| AME ELITE CONSORTIUM BERHAD | | | | |

AME Elite Berhad implement the Green Building Index (GBI), spanning all aspects of the development whereby they integrate sustainable site planning and management, efficient use of natural resources, environmental quality and compliant materials and sourcing. Their projects also retain a high percentage of green areas to promote a nature-oriented working and living environment for their clients. They always maintain an Environment Management Plan Report to monitor waste and effluent management for their industrial parks and take remedial action where appropriate. As they recognise the importance of water efficiency in daily operations to achieve more sustainable utilisation of resources, the industrial buildings are designed to GBI requirements such as installing rainwater harvesting systems, reusing water from detention ponds for the upkeep of landscaping amongst various practices that help conserve natural resources (Figure 7.6). They also use water from the testing and commissioning of pump flow systems that are recycled for reuse, thereby eliminating the discharge of used water into the environment. Moreover, they also use Integrated Building System (IBS) in construction and engineering operations that help reduce water usage in the construction process due to the high mechanisation.

Figure 7.6 Rainwater Harvesting Tank at i-Park's Factories

7.3 Manufacturing

7.3.1 Electrical & Electronics Products

Globetronics builds its sensors and encoders for a variety of automation and industrial applications. Water used in manufacturing sites forms a crucial part of the process for most of the production lines, as unclean water can cause high particle counts that disrupt the ability to produce a quality product. To overcome this problem, Globetronics uses the proper filtration and distilling equipment to always ensure a high-quality water supply to manufacturing lines. Industrial and sewage effluents are measured against a range of parameters to ensure that is compliant with all industry standards. This is measured and reported in the monthly ESG meeting and all subsidiaries comply with effluent discharge. Scheduled production shutdowns to improve UPH and regular preventive maintenance are performed on facilities chiller, cooling tower, strainer, vacuum, transfer pump and circulation pump to reduce the usage of water. For the wafer sawing process, water that is normally discharged to the drain is circulated back to the tank instead. Effluent discharged is measured against legally set parameters which are disclosed in Figure 7.3 whereby all subsidiaries effluent discharge is within the parameters.

| Effluent Discharge Parameters | | | | |
|-----------------------------------|-----------------------------------|--|--|--|
| Biological Oxygen Demand (BOD) | Copper (Cu) | | | |
| ph Value | Manganese (Mn) | | | |
| Suspended Solid | Nickel (Ni) | | | |
| Chemical Oxygen Demand | Tin | | | |
| Oil and Grease | Zina (Zn) | | | |
| Mercury (Hg) | Boron (B) | | | |
| Cadmium (Cd) | Iron (Fe) | | | |
| Chromium Hexavalent (Cró+) | Silver (Ag) | | | |
| Arsenic (As) | Aluminium (Ag) | | | |
| Cyanida (as CN-) | Selenium (Se) | | | |
| Lead (Pb) | Free Residue Chlorine (as Cl2) | | | |

| Colour, ADMI (Adjusted pH) | Ammoniacal Nitrogen | | | |

Table 7.3 Parameters for Effluent Discharge

7.3.2 Food, Beverages & Tobacco

| Nestle | | | |
|--------|--|--|--|

Nestle is one of the world's largest food & beverage companies whereby water is a crucial for its operations. Nestle minimises the impact on water resources by continuously looking for opportunities to better manage its water consumption and wastewater discharge. It takes proactive measures to ensure that water-related activities do not disrupt local water quality and availability. Nestle also engages with external parties regularly to encourage water conservation. As its operations are guided by the Commitment on Water Stewardship in the Nestle Policy on Environmental Sustainability, the Nestle Global Water Stewardship Ladder (Figure 7.7) serves as a point of reference to address the water management issues specific to its operational context by setting out a roadmap for effective shared water consumption and management.

To reduce water consumption, Nestle has upgraded its equipment in Chembong Factory even though the reduction is limited. Furthermore, it also takes a collaborative multi-stakeholder approach to reduce water consumption along its value chain. Nestle is also engaged in ongoing research with rice suppliers on the use of semi-aerobic rice intensification farming methods which consume up to 40% less water than conventional techniques. In addition, it also educates contract farmers and relevant agencies on water conservation practices through the provision of awareness and instructional programmes. To improve industry capacity and support the development of effective regulations, Nestle works with local authorities and stakeholders to share best management practices and environmental performance information. Nestle also regularly engages with relevant regulators, industry players, water utility companies and other stakeholders on the matters of water management.

Figure 7.7 The Nestle Global Water Stewardship Ladder

7.3.3 Transport Equipment & Other Manufacturers

MBM Resources Berhad (MBMR) manufactures automotive parts which sees water conservation as an important aspect as maintaining the water treatment process is crucial to help reduce the consumption as water can be reused or recycled. MBMR constantly monitors its water consumption to meet its goal of lowering water usage. Below are the current water conservation practices in MBMR:

- Water treatment for manufacturing operations in HASB and OMI.
- Rainwater harvesting at Menara MBMR (monitored by MBMR Properties Sdn Bhd).
- Water recycling for manufacturing chiller systems.

MBMR believes that sharing the results of the materiality assessment can be a starting point for continuing the communication and retaining participation for sustainability initiatives. The response and input from all stakeholders are incorporated into the broader sustainability strategy (Figure 7.8).

Figure 7.8 Sustainability in MBMR

7.3.4 Chemicals

| CCM CHEMICALS DIVISION | | | b Col | |
|------------------------|--|--|-------|--|
| | | | | |

CCM Chemicals acknowledge that water is one of the key resources utilised within their operations and the product manufacturing process is dependent on this valuable resource whereby they minimise water usage in their operations and throughout the supply chain to safeguard the environment, reduce water consumption, and ensure a resilient future for the business. CCM Chemicals commit to ensuring that effluent discharge is safe for the environment and does not affect human health by complying with the Department of Environment's stringent regulatory standards and equipping all the manufacturing plants with a wastewater treatment plant. To reduce the operational water footprint, CCM Chemicals initiated a 3Rs Sustainability Programme for Polymer Washed Water in 2016. Additionally, instead of disposing a huge amount of washed water as waste and spending a considerable amount on the disposal of this wastewater, they reduced the disposal costs by more than half between 2015 and 2016. CCM Chemicals have embarked on a wastewater recovery project to ensure zero treated effluent is discharged from their coagulation plant. Wastewater generated from the coagulation plant is collected and treated in the wastewater recovery plant before being recycled for use in the plant's operations. In addition, the CCM Chemicals chlor-alkali plant operates an ionexchange system for its water demineralisation process and its brine solution purification process. Through this project, a low concentration of sodium hydroxide is recovered after the regeneration process and is used in another unit operation whereby they managed to reduce the amount of wastewater discharged from the wastewater treatment process and reduce the effluent discharged into the environment.

MATERIALITY MATRIX

Importance to Business Operations

Figure 7.9 Materiality Matrix of CCM Chemicals

7.3.5 Rubber & Plastic

| TOP GLOVE | | | s de la | Ē |
|-----------|--|--|---------|---|
| | | | | |

Top Glove Corporation Berhad need a sufficient and clean water supply for the glove manufacturing process. At the same time, they do continuously monitor their water consumption and implement initiatives to recycle and reuse water in all their factories to decrease dependency on the municipal source. TOP GLOVE have implemented a few solutions to overcome the problem such as Reverse Osmosis Water Treatment Plant, ensuring continuous water supply for factories' operations, and alleviating flood issues (Figure 7.10). The treatment plant can treat and produce 400 m³/hour of clean water (for 2 phases of this project) that benefits 9 factories. The plant also functions for flood mitigation by alleviating flood through diverting approximately 120 m³/hour (phase 1) and 450 m³/hour of water (phase 2, commenced in June 2020) from drain to pond to be treated and supplied to factories' water supply. Furthermore, TOP GLOVE also recycle and reuse water via in-house water recycling facilities at every factory to treat, recycle, and reuse the water in factories making it possible for housekeeping purposes such as flushing, ROTP initiative, and rainwater harvesting.

Reverse Osmosis Water Treatment Plant

- Total investment: RM42
 million
- Advantage: ensuring continuous water supply for factories operation and alleviation of flood issue
- Maximal capability: treating & producing 400m³/hr of clean water (for 2 phases of this project)
- Beneficiary factories: 9 factories
- Flood event can be alleviated by diverting approximately 120 m³/ hr (phase 1) and 450 m³/ hr (phase 2, commenced in June 2020) water from drain to pond to be treated and supplied to factories

Water recycling

- Water recycling & reuse approach via:
- In-house water recycling facilities at every factory to treat, recycle and reuse the water in our factories, making it possible for housekeeping purpose such as flushing
 ROTP initiative
- Total water recycled & reused in FY2020:

2,431,382 m³

Saving of RM5.5
 million in FY2020

Rainwater harvesting

- 221,366 m³ of water saved from rainwater harvesting
- Saving of RM504,717 in FY2020

Figure 7.10 TOP GLOVE Water Management Plan to Mitigate Water Risk

7.3.6 Wood, Furniture, Paper Products & Printing

and health hazards to employees and the community.

| MUDA Muda Holdings Berhad | | | b Col | |
|------------------------------|--|--|-------|--|
| | | | | |

Muda Holdings Berhad ensures full compliance with applicable environmental laws and regulations to reduce its environmental risk and footprint. Both Kajang and Tasek Paper Mills are equipped with biological effluent treatment plants where all the used water has to go through a series of physical, chemical, and biological treatment processes to ensure the quality of the effluent meets the standards prescribed by the Environmental Quality (Industrial Effluent) Regulations 2009. To maintain efficiency, the biological treatment plants are consistently and properly maintained to ensure optimal operation level to prevent the risk of breakdown as the failure of the biological effluent treatment plants will result in contamination of the rivers.

Table 7.4 MUDA Holdings Berhad Principal Risk

| | Principal Risk | Mitigating Actions |
|----|--|--|
| a. | Supply of raw material for manufacturing of paper Adequate supply of waste paper is key to the continuous operations of the paper mills. Local demand has outpaced supply from the domestic market resulting in risk of shortfall in supply from domestic market and increased cost. | The Group will strengthen its collection centres to maximise procurement of the material from local suppliers. At the same time, the paper mills are establishing a network of supplies from overseas to mitigate the risk of shortfall in supply. |
| b. | New entrants into local market With the new capacities from existing and new paper mills, Malaysia will become a net exporter of paper roll in the near future. The net selling price of paper roll is expected to be lower with the stiff competition. | Continue its effort to achieve gross output at optimum level in order to lower production costs and stay competitive by implementing productivity and quality improvement programmes. |
| C. | Credit Exposure and Liquidity The Group's revenue is mostly made up of domestic sales with credit terms granted. Therefore, trade receivables are subject to the risk of delay in collections. This will cause additional provision for doubtful debts or bad debts written off which will impact the profitability of the Group. | Extension of credit term and credit period to customers are managed in accordance with Credit Control Policy and Procedures to mitigate the risks of bad debts. There were no over commitment in inventories which could affect the Group's liquidity. |
| | The tight cash inflows will in turn cause the delay in payments to suppliers which may lead to liquidity problems if the risks were not well managed. | Credit facilities of the Group were constantly monitored to ensure availability of sufficient working capital. |
| d. | Compliance with Department of Environment ("DDE") Requirements The manufacturing process of paper mills and carton plants in the Group produces sludge, ash, ink and trim waste, emits dusts particles and effluent discharge which have to be treated and/or disposed of in accordance with the requisite regulations. | The Group has invested in waste water treatment plants, a 24- hour continuous emission monitoring system linked to the DOE to monitor dust particles and filter press for the treatment of sludge and also other anciliary equipments and facilities to ensure proper handling and disposal of waste, emission and effluent to comply with the regulatory requirements. |

59

7.3.7 Non-metallic, Mineral Products, Basic Metal & Fabricated Metal Products

| PRESS METAL | | | h Or | |
|-------------|--|--|------|--|
| | | | | |

Press Metal Aluminium Holdings Berhad deems water as an essential resource for its operation, particularly for cooling purposes. Every subsidiary withdraws piped water from local water treatment plants. At its smelting plants, industrial wastewater is discharged because most of the water is used in the cooling process and evaporates upon use. However, at PMBA and PMI, treated industrial water is discharged to sewage drains due to anodising and mould cleaning process. Across all entities, water is also used for domestic purposes in canteens, hostels, and office departments as well as for hydrant pumps in case of emergencies. All domestic wastewater is treated in septic tanks before being discharged into the rivers in compliance with relevant legislation and guidelines. Press Metal Aluminium Holdings Berhad plants are located in areas that are not stressed for water and experience above-average rainfall. As such, no significant water-related risks were recorded in FY2020 and there was no issue sourcing water for operational use. Despite that, the company continues to pay close attention to water resource management and aims to optimise water usage. To avoid any future problems, Press Metal Aluminium Holdings Berhad has implemented broad measures to manage and reduce unnecessary water use. Its water management teams have installed flowmeters at key locations within plants to effectively monitor its daily water withdrawal. Regular inspections of water pipelines are also conducted to identify any potential damage or leakage. To promote water conservation among the employees, stickers are placed at selective water appliances and washrooms to remind them about the importance of saving water. Individual subsidiaries have also carried out several measures to improve water management. The company has also mapped water management practices and produced a water balance diagram to provide a comprehensive review of potential areas of improvement for water use across operations. Furthermore, a rainwater harvesting system is implemented at its smelting plant, PMBtu, to reduce the reliance on potable water. To minimise tap leakage after use, retrofitted water appliances have been equipped with automatic sensors.

| | Our Inputs | Our Management Approach | > | Our Outputs | Outcomes |
|-------------------------------------|---|---|---|---|---|
| Financial Capital | Financial inputs derived from financing and reinvestments of profits from the previous year. | Our subsidiaries and corporate functions work in unison to deliver exceptional aluminium products and services to our customers. | | Revenue: RM7.48 billion | Sustained business and growth Capacity to expand presence in national and international markets Continued income and economic opportunities |

Figure 7.11 Press Metal Aluminium Holdings Berhad's Management Framework

7.4 Mining & Quarrying

7.4.1 Petroleum & Natural Gas

PETRONAS follows PETRONAS's Guidelines on Water Practices (WAPS) to minimise the impact of discharge on surrounding water bodies. WAPS covers the following systems: cooling water, ion exchange, reverse osmosis & electrode ionisation, steam generator system, condensate, wastewater discharge, collection & treatment, and sludge handling. PETRONAS is in the process of setting water reduction targets for its operations. Preliminarily, water audits were conducted following WAPS to assess consumption patterns. In 2019, three audits were completed, another two were conducted in 2020 with five more in the following year. For the water quality report, PETRONAS measures the Chemical Oxygen Demand (COD) of its wastewater which indicates how much oxidisable material it contains. The higher the COD, the lower the dissolved oxygen level in a water body which is harmful to living organisms. All water discharged by PCG is channelled into rivers and the sea and not to enclosed water bodies. In 2019, PETRONAS conducted a water quality study in collaboration with Universiti Putra Malaysia (UPM) that observed whether there was a risk of pellets entering the monsoon drains. The project achieved the desired end goal of zero risks of environmental spills leading to PC LDPE winning a Gold Award at the Malaysia Productivity Corporation Team Excellence Convention in 2019. PETRONAS also collaborated with PETRONAS Downstream Business in a water assimilative capacity study to better understand the conditions required for healthy aquatic life to enhance the wastewater discharge quality beyond regulatory compliance. PETRONAS ensures that contractors comply with the HSE requirements throughout the procurement process. In 2019, PETRONAS enhanced their HSE requirements to include compliance with the newly implemented Road Transport Operational Guideline (RTOG) for improved and safe supply distribution.

7.4.2 Mining (bauxite, gold, coal, iron ore, tin, ilmenite, amang (tin tailing) retreatment & other mining)

Anchor Resources Limited recognises the critical importance of water management to ensure the efficient, safe and sustainable use of water as well as the protection of water resources and ecosystem around its sites. In order not to adversely impact the environment, the gold and granite dimension stone operations of Anchor Resource Limited recycle the water that the operations utilise in a closed water system. Effluents from both the gold mining and the granite dimension stone operations are stored within the ponds on site. AASB uses water supplied by Syarikat Air Terengganu Sdn. Bhd. while GGTM captures and utilises rainfall-runoff only. AASB utilises closed water systems and stores the effluents within the mines to minimise water withdrawal and avoid discharging wastewater into the surrounding waterways.

| | Lubuk Mandi Gold Mine (AASB) | Bukit Chetai Granite Dimension Stone Mine (GGTM) |
|---|---|---|
| • | Operations of tailing plant to produce semi- processed gold concentrated ore | Excavation of granite rocks and production of granite blocks |
| • | Hygiene purposes | Slabbing and sizing to granite strip-slabs and to granite tiles Hygiene purposes |

7.4.3 Quarrying (granite, limestone, sand extraction & other stone)

| MINETECH RESOURCES BERHAD | À | | h Or | Ē |
|---------------------------------|---|--|------|---|
| | | | | |

Minetech Resources Berhad acknowledge water resource management is essential to protect the sites' surrounding ecosystem. In order not to adversely impact the environment, they minimise their water consumption through constant innovative initiatives within the business divisions. Minetech Resources Berhad reuse most of their natural water. Pipes are connected from storage ponds that store harvested rainwater and water from these ponds is used for washing and cleaning activities within quarries and construction sites. Consequently, both quarries and construction sites use minimal water from water authorities. To prevent any untoward incidents in their quarries, they manage all discharges and wastes coming from construction sites and factories utilising chemicals and diesel in accordance with the laws and regulations governing environmental protection.

7.5 Services

7.5.1 Accommodation

| BERJAYA BERJAYA LAND BERHAD | | | |
|--------------------------------|--|--|--|

Berjaya Land Berhad practice best water management practices at their branches. For example, in the Port Dickson Division, they collect and use stormwater for landscaping irrigation and construction cleaning purposes. In Kensington Gardens, stormwater is stored in underground tanks, while in The Tropika and Bayu Timur, On-Site Detention (OSD) tanks are installed to manage the stormwater in compliance with the Urban Storm Water Management Regulation. The Tropika uses GreenRE RB V3.1 Bronze Award as the standard for its Water Efficient Fittings. Such fittings are based on WEPLS, resulting in 10 to 15% savings of water. Sub-meters are installed for better monitoring and control of water usage. The Cold-Water Schematic System Design used in The Tropika identifies the possibility of operational failures prior to the construction and improves the monitoring as well as the distribution of water. The PI Division also installs self-closing pillar tap fittings and dual flush cistern and hand dryers in some of its complexes to reduce water wastage. Bedding and towel laundry in the BHR consumes a significant amount of energy and water. BHR offer guests towels and linens reuse options to reduce water usage. Other initiatives in water conservation include the installation of water flow regulators in the water tap system and the installation of water sub-meters to improve the monitoring of water consumption and early detection of a leak. At The Clubs' golf courses, reclaimed water is used for watering. The golf course area requires specific irrigation care as compared to the other green areas. Water from the river, man-made ponds, and rainwater is used for general cleaning to minimise the usage of potable water.

Figure 7.14 Berjaya Land Berhad Sustainable Pillars

7.5.2 Information & Communication and Transportation & Storage

Telekom Malaysia handle their water management by continuing to recycle water from the surau in Menara TM to reuse for other applications such as watering plants around their buildings. Telekom Malaysia also hold campaigns to raise awareness of water conservation among TM employees.

7.5.3 Arts, Entertainment & Recreation

| SUNWAY ° | | | b Col | |
|-----------------|--|--|-------|--|
| | | | | |

Sunway Group have installed rainwater harvesting systems that have been a key initiative across SUNWAY major operational sites with high water consumption. Approximately RM158,000 has been invested in rainwater harvesting systems for 8% of their sites, and more installations are currently being planned. The total amount of rainwater stored is used for landscape maintenance and cleaning outdoor areas. Sunway Lagoon Theme Park also uses rainwater to top up its Rapid River ride, which saves about RM4,000 or 1,656 m³ per year. Sunway discharge the run-off into water bodies nearby such as lakes and rivers. For example, water from Sunway Spun Pile and Paving Solutions is discharged into the Batang Kali River in Selangor. To ensure that they comply with all regulations, SUNWAY conduct periodic monitoring of Total Suspended Solids (TSS) at each final discharge point to check the quality of wastewater discharge. The silt trap is a temporary ponding area built to collect and store sediment from water run-off and helps in separating silt and other particles thus improving the quality of water before it is reintroduced back into the drainage system. In 2020, there was no report of noncompliance with any regulations regarding water quality. SUNWAY quarry business division has designated locations for water discharge points where the water samples are tested quarterly. The water samples are within specification as per the Environmental Management Plan (EMP) under the Department of Environment.

Figure 7.16 Sunway's water consumption

8.0 Conclusions

Water demand is expected to exceed sustainable supply by 40% in 2030 whereby water supplies are under increasing stress due to population and economic expansion, urbanisation, climate change, and various issues. This could result in water competition between various consumers such as communities, businesses, and industries. This competition has an impact on business and industry's day-to-day operations increasing both operational risks and costs. At the same time, government agencies are tightening regulations on water discharge and extraction making it more difficult for business and industry to stay in compliance. Hence, forward-thinking business and industry entities are increasingly establishing internal and external water-efficiency targets whereby accelerating IWRM implementation has been the goal to make a very strong case for widespread adoption of water reduction, reuse, and recycling practices, as well as a circular approach to water management in general.

This AACB module has laid out the why, what, and how circular water management is practised in order to provide business and industry with the action framework that they need to start reducing, reusing, and recycling water. Acknowledging water consumption and wastewater regeneration in the respective sector provides a baseline for business and industry to better strategise their companies' water management. Water-related policies, legal implications, and economic incentives have been discussed to provide an overview of what would be the drivers, implications, and incentives for business and industry to be aware of whether their current management practices in water management are sustainable and to act responsibly in managing their water resources throughout the value chain.

The amount of water accessible on the earth remains constant; however, water usually follows the same cycle, affected by climate change thus impacting the local or regional water supply and storage. Underlying the IWRM concept, a paradigm shift is needed in transforming water management practices towards circularity whereby understanding the concept of the global water cycle is essential to recognise the risks and costs of current water management practices as well as the benefits of circular water management. In this context, risk-based water management is essential for managing the water resource throughout the value chain as water-related risks affect all sectors of business and industry as all sectors rely on water as an input for their operations.

Water-related risks can be mitigated by adopting circular water management practices based on the 5Rs approach (water reduction, reuse, recycle, restore water reserves, and resource recovery). A sixsteps action framework has been laid out in this module to guide businesses and industries to perform best management practices in their premises and value chains. Local case studies are provided for respective business and industry sectors to emulate, in which collaboration models provided can drive the IWRM implementation in businesses and industries. Circular water management practices present immense potential for business and industry, not only providing them significant efficiency but also huge cost savings to meet companies' water targets.

Hence, business and industry entities need to make a significant paradigm shift to achieve circular water management throughout the value chain. Business and industry sectors need to consider the true costs of water and acknowledge that water management as circular water management practices are the norm rather than the exception to realise the full potential of circular water management for the sustainability of water resources.
